

Jamie Barden, Ph.D., is Professor of Psychology at Howard University. The central theme of his research is to find evidence of the mechanism underlying evaluative judgments. A second theme is to explore the consequences of placing the self and others into social categories (race, gender, age, sexual orientation). His teaching, research, and lab are infused with a human-centered approach to AI.

Student interest drives research questions including: Do people speak differently to the same person when they are the only woman as opposed to the only young person in the room? What happens when people correct for colorism bias? And how does your view of AI shift once you have created your first durable build?

Dr. Barden's work is published in *JPSP*, *JESP*, and *PSPB*, and his research has been supported by *APF* and *NSF*. For more information: <https://jamiebarden.org>
